Categories organize subjects in the app. Names, artwork, colors, order, and visibility are fetched from the server when the category list loads.

Screen / location: Admin → Categories → Add Category

Actual source preview - local demo data - live values may differ

1. Category artwork

2. Name and identity

3. Color, order, and visibility

Step by step

1. Open Categories → Add Category.

2. Enter Category Name. Leave Slug blank to generate it from the name, or enter a unique custom slug.

3. Optionally upload an image up to 2 MB. Choose an Accent Color with the picker or hexadecimal value and enter Sort Order.

4. Enter an optional Description, select Active & visible to mobile players, and click Save Category.

5. Use Edit in the list to change saved fields, replace artwork, or remove the existing image.

Field definitions and change impact

Field / Feature	Definition and source	Effect of changes
Category Name	Required; maximum 255 characters.	Changes the app's category title and subject grouping.
Slug	Optional and unique; generated from the name when blank.	Changes server metadata, not the numeric ID used by API links.
Category Image	Optional image; maximum 2048 KB.	Provides image_url for app artwork. The public storage URL must be accessible.
Accent Color	Required color string; select a hexadecimal color in the picker.	Changes category color data. Each app component decides how to render that color.
Sort Order	Integer; smaller values appear first.	Changes the order of subjects returned by the API.
Description	Optional introductory text.	Changes API description data; not every app view displays it.
Active	Visibility switch.	Inactive categories disappear from the public category list without deleting their records.

Current implementation limit
Do not use Delete to hide content. Deleting a category can cascade to related quizzes and questions. Back up first; use Active for temporary visibility changes.

Data and behavior in detail

Add a category without missing a field

1. Open Categories and choose the add action. Enter the category name, optional unique slug, required color, and display order. Select an image only if you want category artwork.

2. Choose the active state deliberately: an inactive category should not be used as a published learner entry point.

3. Save the form. If validation appears, correct the indicated field and save again. Return to the list and check the name, active state, and order.

4. Open the app category list and reload its data to verify the result. Uploads are stored under public/uploads/categories; changing a documentation screenshot will not change app artwork.

Delete confirmation

Click Delete on the correct category row. The browser asks **Delete this category?** Choose **Cancel** to retain it or **OK** to submit deletion. Category deletion also removes dependent quizzes and questions. After successful deletion, the list refreshes; verify the row is gone before continuing.

Verification after saving

Reopen categories in the app and confirm the name and order. If artwork fails, check the storage link, APP_URL, and image URL.

Technical sources

Server paths are inside Quiz Application Admin; lib paths are inside Quiz Application.

Conclusion Section

Use this guide to configure Quizs, verify the actual app behavior, and keep administrator content, server configuration, and native app changes in their correct places.

Administrator access

Open your own backend domain followed by /admin/login. Use the credentials created for that deployment. Accounts, passwords, and URLs from unrelated reference projects do not apply to Quizs.

Release verification

Complete a category, quiz, question, attempt, result, target/profile, notification, and attendance test. Confirm native integrations separately on the intended device and provider account.
