Create a category first, then a quiz, then its questions. Language controls content selection; duration is saved metadata and is not currently an exam deadline in the Flutter question flow.

Screen / location: Admin → Quizzes → New Quiz

Actual source preview - local demo data - live values may differ

1. Category and difficulty

2. Quiz language

3. Duration, pass score, and active state

Step by step

1. Open New Quiz, select Category, and enter Quiz Title.

2. Choose Easy, Medium, or Hard. Select English only, Hindi only, or Bilingual at creation.

3. Enter Duration of at least 1 minute and Passing Score from 1-100. Set Description and Display Order.

4. Save the quiz as inactive while preparing questions and checking answer keys in Questions Bank.

5. Open Edit Quiz, enable Quiz is active and playable, and Save Quiz. Check that it appears under the correct category and loads questions in the app.

Field definitions and change impact

Field / Feature	Definition and source	Effect of changes
Category	Required existing category.	Determines the subject containing this quiz.
Title / Slug	Title: maximum 255; slug: optional and unique.	Changes the name and server metadata.
Difficulty	easy / medium / hard.	Changes difficulty metadata; it does not automatically rewrite questions.
Language	en / hi / bilingual on creation; bilingual is stored as null.	Single-language quizzes are filtered by language; bilingual quizzes use translations.
Duration	Integer, minimum 1; stored as duration_minutes.	The current Flutter flow does not use it as an exam deadline. Next Trial has a separate fixed 5-second countdown.
Passing Score	Percentage from 1-100.	The server compares correct answers ÷ total questions against this threshold. Passing increments streak; performance messages use separate thresholds.
Active / Display Order	Playability and ordering.	Availability and order change on the next content fetch.

Current implementation limit
Language cannot be changed through Edit Quiz: update validation excludes it. Create another quiz for a different language structure. Edit existing questions to change translations.

Data and behavior in detail

Played and completion rate

played_count is the lifetime number of unique users who completed this quiz. A repeat completion by the same person does not add another unique player. completion_rate reflects the current user's answered progress today, not the pass rate of all users.

Exactly what to choose in the form

1. Open the add quiz form. The Category dropdown starts with Select category... and contains saved category names. If your category is missing, create it in Categories first, then reload this form.

2. Choose Easy, Medium, or Hard from Difficulty. These are metadata labels; they do not automatically change questions or enforce a different scoring rule.

3. Choose the creation language: English, Hindi, or bilingual. Bilingual creation supports paired English and Hindi question content. The edit form does not provide the same language selector, so decide before adding questions.

4. Enter title, duration, passing percentage, and other required fields. Save the quiz, then open Questions and select this quiz to add its four-choice questions.

5. Activate the intended content and test it as a learner. A saved quiz without questions is not a finished quiz.

Filter, edit, and delete

On the quiz list, All Categories shows the complete list. Choose a saved category name to narrow the list. Edit opens the existing quiz; save and reload its details to verify changes. Delete asks **Delete this quiz and all its questions?** Choose **Cancel** to keep the quiz or **OK** to delete it and its questions. Do not use deletion merely to hide a quiz; change its active state instead.

Verification after saving

Open the app in the intended language. Confirm category, difficulty metadata, question order, and playable content. Populate an empty quiz before launch.

Technical sources

Server paths are inside Quiz Application Admin; lib paths are inside Quiz Application.

app/Http/Controllers/Admin/QuizController.php

app/Services/QuizStatsService.php

lib/services/quiz_api_service.dart

Conclusion Section

Use this guide to configure Quizs, verify the actual app behavior, and keep administrator content, server configuration, and native app changes in their correct places.

Administrator access

Open your own backend domain followed by /admin/login. Use the credentials created for that deployment. Accounts, passwords, and URLs from unrelated reference projects do not apply to Quizs.

Release verification

Complete a category, quiz, question, attempt, result, target/profile, notification, and attendance test. Confirm native integrations separately on the intended device and provider account.
