How to register cryptographic SHA-1 fingerprints in Firebase Console to prevent Google Sign-In Error 10.

1. Get Debug SHA-1

```
cd "Quiz Application/android"
./gradlew signingReport
```

Copy the SHA-1 fingerprint under `Variant: debug`.

2. Get Google Play Production SHA-1

In Google Play Console, go to **Release -> Setup -> App Integrity -> App signing key certificate** and copy the SHA-1.

3. Add to Firebase

Go to **Firebase Console -> Project Settings -> Your Android Apps -> Add Fingerprint** and paste both keys. Download the updated `google-services.json` and place it in `Quiz Application/android/app/google-services.json`.

Conclusion Section

Use this guide to configure Quizs, verify the actual app behavior, and keep administrator content, server configuration, and native app changes in their correct places.

Administrator access

Open your own backend domain followed by /admin/login. Use the credentials created for that deployment. Accounts, passwords, and URLs from unrelated reference projects do not apply to Quizs.

Release verification

Complete a category, quiz, question, attempt, result, target/profile, notification, and attendance test. Confirm native integrations separately on the intended device and provider account.
