Configuring and running the mobile app located in `Quiz Application/`.

Open the `Quiz Application` folder.

```
flutter pub get
```

Open `lib/services/api_client.dart` and set your live backend endpoint:

```
class ApiClient {
ApiClient._();
static final ApiClient instance = ApiClient._();

// Set your active production server URL:
static const String baseUrl = 'https://quizs.in/api';

// For Local Emulator testing use: 'http://10.0.2.2:8000/api'
```

```
flutter run
```

Conclusion Section

Use this guide to configure Quizs, verify the actual app behavior, and keep administrator content, server configuration, and native app changes in their correct places.

Administrator access

Open your own backend domain followed by /admin/login. Use the credentials created for that deployment. Accounts, passwords, and URLs from unrelated reference projects do not apply to Quizs.

Release verification

Complete a category, quiz, question, attempt, result, target/profile, notification, and attendance test. Confirm native integrations separately on the intended device and provider account.
